

## REMARKS

Applicants request favorable reconsideration and allowance of the subject application in view of the preceding amendments and the following remarks.

Claims 1, 3-5, 8, 12, 13 and 15-27 are pending in this application, with Claims 1, 19, 22, 25 and 27 being independent. By this Amendment, Applicants have cancelled Claims 2, 6, 7, 9-11 and 14, and amended Claims 1, 3-5, 8, 12, 13 and 15-27.

Applicants gratefully acknowledge the Examiner's indication that the application contains allowable subject matter, and that Claims 19 and 25 would be allowable if rewritten in independent form. Applicants have rewritten those claims in independent form and request allowance thereof.

The drawings stand objected to for formal matters. Attached hereto are replacement drawing sheets for Figures 4-6, as required by the Examiner. In the replacement drawing sheets, "Target that user pays attention" has been changed to --Target that user pays attention to--. No new matter has been added.

Claims 2, 4, 11, 13-16 and 19-21 stand objected to on formal grounds. Applicants have amended the claims to attend to the various matters giving rise to the objection.

The specification stands rejected under 35 U.S.C. § 112, first paragraph. Attached hereto is a substitute specification which corrects informalities in the specification, as required by the Examiner. A marked-up version of the substitute specification, showing the changes made thereto, is also attached. No new matter has been added.

Claims 1-29 stand rejected under 35 U.S.C. § 101. Applicants have amended Claim 29 as suggested in the Office Action. With respect to Claims 1-21, it is the position in the Office Action that the claims could read on a device that has no physical embodiment. Applicants respectfully disagree inasmuch as each of those claims is directed to “an apparatus”. Even if the apparatus may operate by means of software, the software would inherently be executed by hardware of some kind, in order for the term “apparatus” to have any meaning. Accordingly, Applicants traverse this basis for the rejection. With respect to Claims 22-28, it is the position set forth in the Office Action that method claims are non-statutory subject matter. The Office Action cites MPEP § 2106, IV-A, as supporting that position. Applicants do not understand §2106 section to provide any support for the position that method claims are non-statutory subject matter. Furthermore, Applicants submit that method claims are regularly allowed by the U.S. Patent and Trademark Office and are statutorily acceptable. Accordingly, Applicants also traverse this ground of the rejection.

Thus, Applicants request withdrawal of the rejection under 35 U.S.C. § 101.

Claims 2, 4-6, 9 and 24-26 stand rejected under 35 U.S.C. § 112, second paragraph, as being indefinite. Applicants have amended the claims to attend to the matters noted in the Office Action as giving rise to the rejection of Claims 2, 6 and 24-26. With respect to Claims 4, 5 and 9, Applicants submit that “discrimination information” would be readily understood by one of ordinary skill in the art, and thus is not indefinite.

Accordingly, Applicants request withdrawal of the rejection under § 112, second paragraph.

Claims 1, 2 and 9 stand rejected under 35 U.S.C. § 102(b) as anticipated by “First Person Indoor/Outdoor Augmented Reality Application: ARQuake” (Thomas et al.). Claims 1-3 and 7-10 stand rejected under 35 U.S.C. § 103(a) as unpatentable over Thomas et al. in view of “Integrating Virtual and Augmented Realities in an Outdoor Application” (Piekarski et al.). Claims 4 and 5 stand rejected under 35 U.S.C. § 103(a) as unpatentable over Thomas et al. in view of “Tinmith-Metro: New Outdoor Techniques for Creating City Models with an Augmented Reality Wearable Computer” (Piekarski et al. 2001). Claim 6 stands rejected under 35 U.S.C. § 103(a) as unpatentable over Piekarski et al. in view of U.S. Patent Publication 2002/0164066 (Matsumoto). Claims 11, 12, 15-18, 22-23 and 27 stands rejected under 35 U.S.C. § 103(a) as unpatentable over Thomas et al. in view of Piekarski et al. and “First Person Indoor/Outdoor Augmented Reality Application: ARQuake” (Thomas, et al. 2002). Claims 20, 21, 24 and 26 stand rejected under 35 U.S.C. § 103(a) as unpatentable over Thomas et al. in view of Piekarski, et al., Sierra™ - Sarsiege: Tribes!® Game (Tribes) and Thomas et al. 2002.

As recited in independent Claim 1, Applicants invention is directed to an information presentation apparatus in which a viewpoint position and orientation measurement unit measures a position and orientation of a user's viewpoint, and in which an input unit inputs viewpoint position and orientation information of an other user. An annotation image generation unit generates an annotation image from annotation data, based on position and orientation information of the user and the viewpoint position and orientation information of the other user. The image of the real world, the virtual world image and the annotation image are composited and displayed.

Independent Claim 22 is directed to an information processing method. The method includes the steps of generating a virtual world image according to viewpoint information, by using previously held virtual world data; inputting viewpoint information of an other user, and generating an annotation concerning an attention target based on the viewpoint information of the user and the viewpoint information of the other user. An image is generated based on the image of the real world, a generated virtual world image and the generated annotation.

Independent Claim 27 is directed to a computer-executable program for causing a computer to perform an information processing method. The method includes steps generally similar to those recited in independent Claim 22.

With the configuration of the present invention, in a system in which mixed reality space is shared by plural users, it is possible to indicate to one user the status of viewpoint information of an other users.

Thomas et al. and Thomas et al. 2002 generally describe that a virtual image is synthesized onto a real image to form a mixed reality in gaming. Although the systems described in those documents discuss plural users, the annotation information concerning an other user is not generated and displayed, as in the present invention.

Piekarski et al. is generally cited as describing a wireless connection in gaming. While the Office Action also cites this document as describing annotated information, Applicants submit that Piekarski et al. does not describe the use of viewpoint information of another user, as now recited in the independent claims.

Piekarski et al. 2001 is cited in the Office Action as describing gaming environments utilizing information about polygons. Pham et al. is cited in the Office

Action as teaching specific algorithms to be used in mixed reality systems. Tribes is cited in the Office Action as describing the use of colored arrows to point out teammates and enemies in gaming displays. Applicants submit that these documents fail to remedy the deficiencies discussed above with respect to Thomas et al., Thomas et al. 2002 and Piekarski et al.

Accordingly, Applicants submit that the applied references, when taken alone or in combination, fail to disclose or suggest at least the features of an annotation image generation unit generating an annotation image from the annotation data, based on position and orientation information of a user and viewpoint position and orientation information of an other user, and a composite unit compositing the image of the real world, the virtual world image and the annotation image, as generally recited in independent Claim 1. Applicants also submit that these documents fail to disclose or suggest at least the features of inputting viewpoint information of a user; inputting viewpoint information of an other user; generating an annotation concerning an attention target based on the viewpoint information of the user and the viewpoint information of the other user; and generating an image obtained by synthesizing an image of a real world, a generated virtual world image and the generated annotation, as generally recited in independent Claims 22 and 27.

The remaining claims in this application are dependent claims which depend from the independent claims discussed above. Thus, Applicants submit that the dependent claims are allowable for at least the reasons discussed above with respect to the independent claims. Those dependent claims also recite additional features further

distinguishing them from the cited references. Applicants request favorable and independent consideration thereof.

For the foregoing reasons, Applicants request withdrawal of the rejections under 35 U.S.C. §§ 102 and 103.

Applicants' undersigned attorney may be reached in our Washington, D.C. office by telephone at (202) 530-1010. All correspondence should continue to be directed to our below-listed address.

Respectfully submitted,

## INFORMATION PRESENTATION APPARATUS AND INFORMATION PROCESSING METHOD THEREOF

### BACKGROUND OF THE INVENTION

#### Field of the Invention

15 The present invention relates to an information presentation apparatus which presents an image obtained by synthesizing (or composing) a real world and a virtual world, and an image processing method of the information presentation apparatus.

#### Related Background Art

20 Recently, proposals have been made for an apparatus [[to]] which would use and apply a mixed reality (MR) technique of naturally combining a real world and a virtual world with each other without uncomfortableness ~~is applied is~~ actively proposed. Among them~~[[,]]~~ is an apparatus which superimposes ~~superposes~~ virtual information on the real world and/or the virtual world observed by a user wearing a head mounted display (HMD), and presents the obtained  
25 information to the user is proposed, whereby it is expected in this apparatus to improve working properties concerning engineering work, maintenance and the like. For example, a method of supporting a surveying work by superposing virtual flags on the image of the real world and then displaying the obtained image on the user's HMD is proposed. However, many of these apparatuses are premised on ~~use~~  
30 ~~of being used by only a single one~~ user, whereby it is difficult to say that these apparatuses are suitable for ~~the working in which~~ uses such as conferences, lectures, cooperation or the like that ~~shares~~ involves sharing a single mixed reality (MR) space with plural persons ~~is necessary~~.

In other words, in ~~the~~ a case where ~~the plural~~ two or more persons perform ~~the~~ are involved in a conference, ~~the~~ lecture or the like by sharing the single MR space, it is necessary for these persons to observe the same target and thus share the information concerning the target in question.

5

## SUMMARY OF THE INVENTION

An object of the present invention is to be able to provide predetermined information to users, by superposing an annotation on an image obtained by synthesizing a real world and a virtual world.

10

For example, the present invention aims to provide a means for transmitting a target that one user wishes to cause another user to pay attention, a means for knowing position and direction of a target that users should pay attention, or a means for knowing whether or not a target ~~that~~ to which one user is paying attention at present is observed by another user.

15

In order to achieve the above object, one aspect of the present invention is ~~characterized by~~ an information presentation apparatus comprising:

a user operation input unit, adapted to input an operation of a user;

a user viewpoint position and pose measurement unit, adapted to measure a position and pose at a user's viewpoint;

20

a model data storage unit, adapted to store virtual world model data, real world model data, and data necessary to generate a virtual world image;

an annotation data storage unit, adapted to store data necessary to be added to a real world and a virtual world and then displayed;

25

a virtual image generation unit, adapted to generate an image of the virtual world by using information in the user viewpoint position and pose measurement unit, the model data storage unit and the annotation data storage unit;

a user viewpoint image input unit, adapted to capture an image of the real world viewed from the user's viewpoint; and

30

an image display unit, adapted to display an image obtained by synthesizing the image generated by the virtual image generation unit and the

image obtained by the user viewpoint image input unit, on an image display device of the user.

Moreover, to achieve the above object, another aspect of the present invention is ~~characterized by~~ an information processing method comprising the steps of:

inputting viewpoint information of a user;  
generating a virtual world image according to the viewpoint information, by using previously held virtual world data;  
generating an annotation concerning an attention target; and  
generating an image obtained by synthesizing an image of a real world, generated virtual world image and the generated annotation.

Moreover, to achieve the above object, the present invention is characterized by a program to achieve an information processing method comprising the steps of:

inputting viewpoint information of a user;  
generating a virtual world image according to the viewpoint information, by using previously held virtual world data;  
generating an annotation concerning an attention target; and  
generating an image obtained by synthesizing an image of a real world, generated virtual world image and the generated annotation.

Other objects and features of the present invention will become apparent from the following description taken in conjunction with the accompanying drawings.

## BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a block diagram schematically showing the structure of an information presentation apparatus according to the one embodiment of the invention;

Fig. 2 is a block diagram showing the structure in a case where plural information presentation apparatuses are mutually connected together through a transmission channel, according to the embodiment of Fig. 1;

Fig. 3 is a flow chart for explaining a processing procedure in the information presentation apparatus;

Fig. 4 is a diagram for explaining a means which informs, in a case where a target that to which a watching user is pay[[s]]ing attention is outside a visual  
5 range of a watched user, informs the watched user of the position of the target, according to the that embodiment;

Fig. 5 is a diagram for explaining a means which informs, in a case where the target that to which the watching user is pay[[s]]ing attention is inside the visual range of the watched user, informs the watched user of the target and  
10 information concerning the target, according to the that embodiment;

Fig. 6 is a diagram for explaining a means which presents to the watching user whether or not the target that to which the watching user is pay[[s]]ing attention is inside the visual range of each watched user, according to the that embodiment; and

Fig. 7 is a diagram for explaining a means which presents to a user positions where other users exit, according to the that embodiment.

## DESCRIPTION OF THE PREFERRED EMBODIMENTS

Hereinafter, the preferred embodiments of the present invention will be  
20 described with reference to the accompanying drawings.  
(One Embodiment)

Fig. 1 is a block diagram schematically showing the entire overall structure [[to]] in which an information presentation apparatus and an information presentation method according to the this embodiment are applied.

25 A user operation input unit 101 is an input device which consists of, e.g., push button switches, a mouse, a joystick and the like. When a user of an information presentation apparatus 100 operates or handles the user operation input unit 101, control information according to operation(s) contents by the user is transferred to a virtual image generation unit 105.

30 A user viewpoint position and pose measurement unit 102 is a position and pose measurement device such as a magnetic sensor, an optical sensor or the

like. The user viewpoint position and pose measurement unit 102 measures a position and pose at a user's viewpoint by six degrees of freedom and transfers a measured result to the virtual image generation unit 105. Since it is generally difficult to set the position and pose measurement device at the user's viewpoint, the user viewpoint position and pose measurement unit 102 has a function to calculate the position and pose at the user's viewpoint on the basis of the output result of the position and pose measurement device. For example, in a case where the position and pose measurement device is fixed to a user's head, a relation between the output of the position and pose measurement device and the position and pose at the user's viewpoint is always maintained constant, whereby the relation is expressed by a certain expression. Therefore, by obtaining the certain expression in advance, the position and pose at the user's viewpoint is calculated based on the output from the position and pose measurement device. ~~Besides,~~ In addition, it is possible to capture an image of a real world by using a user viewpoint image input unit 106, and thus perform [[an]] image processing on [[of]] the captured image to correct an error in the output result of the position po[[s]]se measurement device. In ~~the~~ this image processing, for example, positions of plural feature points of which the three-dimensional coordinates in a real space have been known are detected from the image, the detected positions are compared with the positions of feature points of the image calculated from the output result of the position and pose measurement device to calculate the error in the output result of the position po[[s]]se measurement device, and the output result of the position and pose measurement device is corrected so as to delete the calculated error. Moreover, it is possible to calculate the position and pose at the user's viewpoint only from the image processing.

A model data storage unit 103 is an auxiliary storage device or medium such as a hard disk, a CD-ROM or the like. The model data storage unit 103 holds and stores virtual world model data necessary to draw a virtual world by computer graphics (CG), real world model data necessary [[to]] accurately to synthesize the

real world and the virtual world, and data necessary to generate a virtual world image. Here, the virtual world model data includes three-dimensional coordinates of vertices of a polygon of a virtual CG object arranged on the virtual world, structure information of faces of the polygon, discrimination information of the CG object, color information of the CG object, texture information of the CG object, size information of the CG object, position and pose information indicating the arrangement of the CG object in the virtual world, and the like. The real world model data includes three-dimensional coordinates of vertices of a polygon of an object existing in the real world merged with the virtual world, structure information of faces of the polygon, discrimination information of the object, size information of the object, position and pose information indicating the arrangement of the object, and the like. The data necessary to generate the virtual world image includes size and angle of an image pickup element of an image pickup device of the user viewpoint image input unit 106, and internal parameters such as an angle of view of a lens, a lens distortion parameter and the like. The information stored in the model data storage unit 103 is transferred to the virtual image generation unit 105. Here, the model data storage unit 103 is not limited to ~~that~~ one provided inside the information presentation apparatus 100, that is, the model data storage unit 103 may be provided outside the information presentation apparatus 100 so as to transfer the data to the virtual image generation unit 105 through a transmission channel 200.

An annotation data storage unit 104 is an auxiliary storage device or medium such as a hard disk, a CD-ROM or the like. The annotation data storage unit 104 holds and stores annotation data which indicates additional information to be displayed on the real world and the virtual world. The annotation data includes position and pose information of the object in the real world and the virtual world, discrimination information of the object, and text, symbol and image information for indicating the object to a user. Here, the annotation data storage unit 104 is not limited to ~~that~~ one provided inside the information presentation apparatus 100, that is, the annotation data storage unit 104 may be provided outside the information

presentation apparatus 100 so as to transfer the data to the virtual image generation unit 105 through the transmission channel 200.

The virtual image generation unit 105 is actualized by a CPU, a microprocessor unit (MPU) or the like mounted in a computer. On the basis of position and pose information indicating the position and pose at the user's viewpoint obtained from the user viewpoint position and pose measurement unit 102, the virtual image generation unit 105 sets the user's viewpoint in the virtual world, draws the model data stored in the model data storage unit 103 by the CG from the set viewpoint, and thus generates the image of the virtual world viewed from the user's viewpoint. Moreover, as shown in Fig. 2, the virtual image generation unit 105 which has a function to transmit the data to the transmission channel 200 and receive the data from the transmission channel 200 is connected mutually to a virtual image generation unit 105 of another information presentation apparatus 100 through the transmission channel 200 so as to exchange necessary information between them. Thus, plural users use the respective information presentation apparatuses 100, whereby they can share the same (or identical) MR space. Fig. 2 is the block diagram showing the structure in the case where the plural information presentation apparatuses 100 mutually connected together through the transmission channel 200 are used by the plural users. In accordance with the position and pose at the user's viewpoint obtained from the user viewpoint position and pose measurement unit 102 and the position and pose of another user's viewpoint obtained through the transmission channel 200, the virtual image generation unit 105 generates an annotation to be presented to the user, on the basis of the annotation data stored in the annotation data storage unit 104. Then, the virtual image generation unit 105 superimposes ~~superposes~~ the generated annotation on the image of the virtual world, and further displays the obtained image. Here, the generated annotation is not limited to a two-dimensional annotation. That is, the virtual image generation unit 105 may generate a three-dimensional annotation and draw the generated annotation by the CG together with the virtual world model stored in the model data storage unit 103. Incidentally, the virtual image generation unit 105 has a function to operate the virtual world and

control the generated annotation according to user's operation information transferred from the user operation input unit 101.

5 The user viewpoint image input unit 106 which includes one or two image pickup devices such as a CCD camera or the like captures an image of the real world which greets the user's eyes and then transfers the captured image to an image display unit 107. Here, in a case where the image display unit 107 is equipped with an optical see-through HMD, the user can directly observe the real world, whereby the user viewpoint image input unit 106 is unnecessary in this case.

10 The image display unit 107 includes an image display device such as the HMD, a display or the like. The image display unit 107 synthesizes the image of the real world greeting the user's eyes and captured by the user viewpoint image input unit 106 and the image of the virtual world generated by the virtual image generation unit 105 together and then displays the synthesized image right in front of the user's eyes. Here, in the case where the image display unit 107 is equipped with the optical see-through HMD, the image of the virtual world generated by the  
15 virtual image generation unit 105 is displayed right in front of the user's eyes. Here, it should be noted that the image display unit 107 also acts as an image drawing unit according to an operation.

20 The transmission channel 200 is a medium which achieves a wired or wireless computer network. The plural information presentation apparatuses 100 are connected to the transmission channel 200, whereby the data to be mutually exchanged among the information presentation apparatuses 100 flows in the transmission channel 200.

25 Hereinafter, control of the embodiment in which the above structure is provided will be explained. Fig. 3 is a flow chart for explaining a process procedure in the information presentation apparatus according to the embodiment.

In a step S000, the information presentation apparatus is activated, and a process necessary for initialization is performed.

30 In a step S100, the user's operation [[to]] with the user operation input unit 101 is recognized and converted into a control signal according to the operation

content, and the obtained control signal is transferred to the virtual image generation unit 105.

5 In a step S200, the position and pose information indicating the position and pose at the user's viewpoint is measured by the user viewpoint position and pose measurement unit 102, and the obtained information is transferred to the virtual image generation unit 105.

10 In a step S300, the image of the real world viewed from the user's viewpoint is captured by the user viewpoint image input unit 106, and the captured image is then transferred to the image display unit 107. Here, in the case where the image display unit 107 is equipped with the optical see-through HMD as the display, the user can directly observe the real world, whereby the processing in the step S200 is unnecessary.

15 In a step S400, communication data is received by the virtual image generation unit 105 through the transmission channel 200. For example, the communication data includes identification number information of each user using the information presentation apparatus 100, name information capable of discriminating each user, position and pose information of each user's viewpoint, operation information of each user, the annotation data and the like.

20 In a step S500, the annotation to be presented to the user is determined by the virtual image generation unit 105 on the basis of the user's operation information obtained in the step S100, the position and pose information at the user's viewpoint obtained in the step S200, and the information concerning other user obtained in the step S400.

25 In the step S500, when a target in the real world or the virtual world that one user pays attention is notified to other users so that the other users pay attention to it, the plural users resultingly share the information in the MR space, whereby it is very useful for the plural users to perform working in which conference, lecture, cooperation or the like is necessary. Hereinafter, a means to achieve such an effect will be explained.

30 First, the data concerning the target that the user pays attention at present is retrieved and selected from the information of the objects in the real world and

the virtual world stored in the annotation data storage unit 104. Incidentally, the target that the user pays attention may be automatically recognized and selected by the information presentation apparatus 100 or manually selected according to the user's operation on the user operation input unit 101.

5           In the method of automatically recognizing the target that the user pays attention, it is thought to use the position and pose information indicating the position and pose at the user's viewpoint obtained in the step S200 and the internal parameters of the image pickup device held in the model data storage unit 103.

10           Incidentally, in the step S500, all candidates of the targets existing inside the user's visual range are captured from the annotation data storage unit 104 on the basis of the internal parameters of the image pickup device and the position and pose information indicating the position and pose at the user's viewpoint. Then, in regard to the captures candidate, a Euclidean distance between a user's visual line and a point representative of the target is calculated, and the candidate for which  
15           the Euclidean distance is minimum can be considered as an attention target.

          In case of judging whether or not one target is within the user's visual range, for example, it is thought to do so by the calculation from the position and pose information indicating the position and pose at the user's viewpoint obtained from the user viewpoint position and pose measurement unit 102 and the internal  
20           parameters of the image pickup device provided in the user viewpoint image input unit 106. That is, the target is projected on an image screen from the position and pose at the user's viewpoint by using the internal parameters of the image pickup device. Then, when the coordinates of the target projected on the image screen exist within a certain range defined by the size of the image, it is judged that the  
25           target in question is within the user's visual range.

          It is assumed that a matrix created from the internal parameters of the image pickup device is given as follows.

$$K = \begin{pmatrix} \alpha_u & -\alpha_u \cot \theta & u_0 \\ 0 & \alpha_v / \sin \theta & v_0 \\ 0 & 0 & 1 \end{pmatrix}$$

30

where each of the symbols  $\alpha_u$  and  $\alpha_v$  indicates a pixel size of the image pickup device, the symbol  $\theta$  indicates an angle between the longitudinal and lateral axes of the image pickup element, and the symbols  $u_0$  and  $v_0$  indicate coordinates of the pixel center. Moreover, it is assumed that a matrix created from the position and pose at the user's viewpoint is  $P = (Rt)$ , where the symbol  $R$  indicates a rotation matrix of three rows and three columns representing the pose at the user's viewpoint, and the symbol  $t$  indicates a three-dimensional vector of the position of the user's viewpoint. Besides, it is assumed that the three-dimensional coordinates of the target are given as  $x = (X, Y, Z, 1)^T$  by using the expression of the homogeneous coordinates, and the coordinates of the point of the target projected on the image screen are given as  $u = (u, v, w)^T$  by using the expression of the homogeneous coordinates.

The coordinates  $u$  of the point of the target projected on the image screen can be obtained by calculation of  $u = KP^{-1}x$ . Then, when it is assumed that  $[[a]]$  the range of the image in the  $u$ -axis direction is  $[u_{\min}, u_{\max}]$  and  $[[a]]$  the range of the image in the  $v$ -axis direction is  $[v_{\min}, v_{\max}]$ , if  $u_{\min} \leq u \leq u_{\max}$  and  $v_{\min} \leq v \leq v_{\max}$  are satisfied, it can be known that the target in question is within the user's visual range.

To calculate a distance between a straight line obtained from the position and pose at the user's viewpoint and the point representative of the target, it is thought to obtain the vector which passes the point representative of the target and crosses the user's visual line and then calculate the minimum value of the length of the vector in question.

The user's visual line is expressed as  $v = t + kp$ , where the symbol  $t$  indicates the three-dimensional vector of the position of the user's viewpoint, the symbol  $p$  indicates a three-dimensional vector of the pose at the user's viewpoint, and the symbol  $k$  is a real number other than "0."

Moreover, the point representative of the target is expressed by a three-dimensional vector  $b$ . Then, when it is assumed that the point where the vector passing the three-dimensional vector  $b$  and orthogonal to the visual line crosses the

visual line is given as  $t + mp$ , the value  $m$  which minimizes the distance between the point  $t + mp$  and the three-dimensional vector  $b$  may be obtained. That is,  $\|t + mp - b\|$  is the distance between the visual line and the point representative of the target.

5                   When this distance is calculated,  $\|t - b + (p \cdot (b - t) / \|b\|^2)p\|$  is obtained.

                  Incidentally, as a method of selecting the target that the user pays attention by handling and operating the input device of the user operation input unit 101, it is thought that the watching user operates the input device by using the mouse or the joystick as watching the synthesized image displayed on the image display unit  
10   107. For example, the user handles and moves the mouse to the position where the attention target is being displayed, and then depresses the button of the mouse at that position, thereby selecting the desired target. Then, when the cursor handled by the user reaches the position where the object stored in the annotation data storage unit 104 is being displayed, the user can confirm whether or not the data  
15   concerning the object is being stored in the annotation data storage unit 104 by generating the annotation concerning the object.

                  An identification number of the target that the user pays attention is transferred to the transmission channel 200 in a step S600. At the same time, ~~also~~ a user identification number and the position and pose information are  
20   also transferred to the transmission channel 200. Moreover, in the step S400, the identification number information of the target ~~that~~ to which another user is pay[s]ing attention, the [[an]]other user's identification number and the position and pose information are received from the transmission channel 200.

                  In the virtual image generation unit 105 of the information presentation  
25   apparatus 100 which is used by one user (called a watched user hereinafter), when it is judged that the target that another user (called a watching user hereinafter) pays attention is outside the visual range of the watched user, the annotation indicating the direction of the target is generated. This annotation includes symbols, characters, images and the like. To enable to easily recognize the target  
30   that which watching user is paying attention, it is possible to generate an

annotation of which the attributes such as a color, a shape, a character type and the like have been changed in regard to each watching user, or an annotation which indicates a name capable of discriminating the watching user. Thus, when the watched user turns toward the direction indicated by the annotation, he can watch the target that the watching user is observing.

When the target that the watching user is paying attention is inside the visual range of the watched user, the annotation indicating the information of the target in question is generated. At that time, the attributes of the generated annotation such as the color, the shape, the character type and the like are made different from those of other annotation so as to make the generated annotation remarkable.

Moreover, when the watched user uses the input device of the user operation input unit 101, he or she can control the target of the generated annotation. For example, it is possible to select the specific watching user and then generate only the annotation concerning the target that the selected specific watching user pays attention. On the contrary, it is possible to generate the annotation concerning the target that to which all the watching users are paying attention. In this case, such a selection is performed not only by the watched user's operation with use of the input device but also by the previous input before the step S000.

Fig. 4 shows a situation that, in a case where a user 1 being who is the watching user observes a certain building and the building is outside the visual range of a user 2 being who is the watched user, the arrow indicating the direction of the building and the annotation indicating the name of the user 1 are generated and displayed on the screen to be presented to the user 2.

Fig. 5 shows a situation that in which, in a case where the user 1 being who is the watching user is paying attention to the certain building and the building is inside the visual range of the user 2 being who is the watched user, the annotation (black background and white text) indicating the name of the building is generated and displayed on the screen to be presented to the user 2. In this situation, the attributes (black background and white text) of the generated

annotation are made different from the attributes (white background and black text) of another annotation, so as to make the generated annotation remarkable.

In the information presentation apparatus 100 which is used by the watching user, in a case of generating the annotation of the information concerning the attention target, the attributes (color, shape, character type, etc.) of the annotation to be generated are made different from those of other annotations so as to make the annotation to be currently being generated remarkable, that is, to make it easy to distinguish. Moreover, the annotation of the information indicating whether or not the attention target is being observed by the watched user is generated and is presented to the watching user.

Fig. 6 shows a situation that the user 1 being who is the watching user is paying attention to the certain building, and the annotation (black background and white text) indicating the name of the building is generated and is made to have the attributes different from those of other annotations so as to make the generated annotation remarkable. Moreover, Fig. 6 shows a situation that in which the annotation of the information indicating whether or not the watched users are paying attention to the building is generated and displayed.

Moreover, in the information presentation apparatus 100 of each user, in a case where another user exists inside the visual range of the user in the real world, the annotation indicating the name capable of discriminating that ([[an]]other) user is generated. On the contrary, in a case where another user does not exist inside the visual range of the user in the real world, the annotation including the arrow indicating the direction of each user and the name capable of discriminating that user is generated.

Fig. 7 shows a situation that the annotation indicating the position of a user 4 existing inside the visual range of the user 1 is generated and displayed on the image screen of the user 1, and the annotation including the arrow indicating the direction of the users 2 and 3 existing outside the visual range of the user 1 and the names capable of discriminating these users is generated and displayed on the image screen of the user 1.

In the step S600, the communication data is transferred from the virtual image generation unit 105 to the transmission channel 200. For example, the communication data includes the identification number information of each user using the information presentation apparatus 100, the name information capable of discriminating each user, the position and pose information of each user's viewpoint, the operation information of each user, the annotation data and the like.

In a step S700, in accordance with the model data stored in the model data storage unit 103, the user's viewpoint is set based on the position and pose information at the user's viewpoint obtained in the step S200, and the virtual world which can be viewed from that viewpoint is drawn. Moreover, the annotation determined in the step S600 is superimposed ~~superposed~~ and drawn on the image of the virtual world.

In the step S700, the image of the real world viewed from the user's viewpoint position and obtained in the step S200 may be first drawn as the background, and the virtual world and the annotation may be then superimposed ~~superposed~~ and drawn on the background. At that time, in [[a]] step S800, a process of only outputting the image obtained as the result of the drawing to the image display device.

In the step S800, the image of the real world viewed from the user's viewpoint position and obtained in the step S200 and the image of the virtual world generated in the step S700 are synthesized, and then the synthesized image is drawn and output to the image display device. Here, in the case where the image display device of the image display unit 107 is equipped with the optical see-through HMD, the image of the virtual world is drawn and output to the image display device.

In [[a]] step S900, it is judged whether or not to end the operation of the information presentation apparatus 100. When it is judged not to end the operation, then the flow returns to the step S100, while when it is judged to end the operation, the process ends as a whole.

According to the present embodiment, it is possible to notify another user of the target ~~that~~ to which one user wishes to cause the other user to pay attention,

it is possible for the user to know the position and the direction of the target ~~that~~  
~~the user should pay attention in question~~, and it is further possible to know whether  
or not the target ~~that~~ to which one user is paying attention at present is observed by  
other user. Therefore, it is easy to ~~perform the working in which the~~ conferences,  
5 ~~the lectures, the cooperation~~ collaborative work or the like ~~that in which it is~~  
necessary for ~~shares~~ the single mixed reality space to be shared with the plural  
persons ~~is necessary~~.

(Other Embodiment)

10           The object of the present invention can also be achieved ~~even~~ in a case  
where a storage medium (or a recording medium) storing therein program codes of  
software to realize the functions of the above embodiment is supplied to a system  
or an apparatus, and thus a computer (or CPU, MPU) in the system or the apparatus  
reads and executes the program codes stored in the storage medium. In this case,  
15 the program codes themselves read from the storage medium realize the functions  
of the above embodiment, whereby the storage medium storing these program  
codes constitutes the present invention. Moreover, it is needless to say that the  
present invention includes not only a case where the functions of the above  
embodiment are realized by executing the program codes read by the computer, but  
20 also a case where an operating system (OS) or the like running on the computer  
performs a part or all of the actual processes on the basis of instructions of the  
program codes and thus the functions of the above embodiment are realized by  
such processes.

          Moreover, it is needless to say that the present invention also includes a  
25 case where, after the program codes read from the storage medium are written into  
a function expansion card inserted in the computer or a memory in a function  
expansion unit connected to the computer, a CPU or the like provided in the  
function expansion card or the function expansion unit performs a part or all of the  
actual processes on the basis of the instructions of the program codes, and thus the  
30 functions of the above embodiments are realized by such processes.

As many apparently widely different embodiments of the present invention can be made without departing from the spirit and scope thereof, it is to be understood that the present invention is not limited to the specific embodiments thereof except as defined in the appended claims.

ABSTRACT OF THE DISCLOSURE:

An information presentation apparatus comprises an input unit, a measurement unit to measure a user's viewpoint position and pose, a model data storage unit to store virtual world model data, real world model data, and data  
5 necessary to generate a virtual world image, an annotation data storage unit to store data added to real and virtual worlds and displayed, a generation unit to generate an image of the virtual world by using information in the measurement unit, the model data storage unit and the annotation data storage unit, a user viewpoint image input unit to capture a real-world image viewed from the user's viewpoint, and an image  
10 display unit to display an image obtained by synthesizing the image from the generation unit and the image from the user viewpoint image input unit or the image from the user viewpoint image input unit, on a user's image display.
